

Spinr — support knowledge base (Chatbase training source)

Paste this document into Chatbase as a text/document source alongside the website crawl. Every statement matches shipped behavior — update this file first when behavior changes, then re-sync the agent.

What is Spinr?

Spinr turns the product photos a store already has (1–4 angles) into an interactive 360° spin that shoppers can drag with a mouse or finger, directly on the product page. The spin is generated by AI in a few minutes. No photography rig, no 3D modeling, no code required.

Who is Spinr for? (Shopify AND everyone else)

Spinr serves two audiences:

- **Shopify merchants** — the Spinr Shopify app gives the full integrated experience: pick a product from your catalog, one-click push to the product page, billing through your Shopify invoice.
- **Global / non-Shopify users** — any store or website worldwide can use Spinr through thespinr.com: upload photos, get the spin, and paste a one-line embed that works on WooCommerce, Wix, Squarespace, Webflow, BigCommerce, and custom-built sites. If a visitor asks "does Spinr work with [any platform]?" the answer is yes wherever a line of HTML can be added to a page.

Never tell a non-Shopify user that Spinr is Shopify-only — it isn't.

How it works

- Pick a product (Shopify app) or upload 1–4 photos (thespinr.com).
- Spinr removes the photo backgrounds automatically and generates a smooth 360° rotation with studio-style lighting.

- Push the spin to your product page in one click (Shopify), or paste a one-line embed on any other website.

Photo guidelines (most common support topic)

- 1–4 photos of the product: front, back, and sides work best. Four evenly-spaced angles give the best result.
- Ordinary catalog photos or phone photos are fine.
- Even lighting and roughly the same distance for every angle.
- Any background is fine — it's removed automatically.
- One product per photo: if photos show a pair (e.g. both shoes), the spin renders a single item.
- In the Shopify app, Spinr uses the first 4 images on the product, in their gallery order (1st = front, then back, left, right).

Shopify app usage

- Install from the Shopify App Store; the app opens inside the Shopify admin. No separate account or password is needed.
- Click "Create spin" on any product with at least one photo. A progress bar shows generation status — usually a few minutes; the page updates itself.
- When the spin is ready, click "Push to page" to put it on the product page.
- One-time theme setup: click "Add the Spinr block" in the app — it opens the Theme Editor with the "Spinr 360° spin" block added to the product template; click Save. This is needed once per theme; after that every pushed spin appears automatically on its product page. Products without a spin are unaffected.
- Not happy with a result? Click "Regenerate" on the product row (it asks for confirmation because a regeneration uses one spin credit).
- While a spin regenerates, the existing spin stays live on the storefront — it is only replaced when the new one finishes

successfully.

Using Spinr WITHOUT Shopify

- Create spins at thespinr.com (sign in with Google), then copy the embed snippet from the result page. It is one line of HTML (a div plus a script tag) that works on any website that allows embeds:

WooCommerce, Wix, Squarespace, Webflow, custom sites.

- Paid plans for non-Shopify users are coming soon; today the free plan (3 spins) is available on the web, and paid plans are available through the Shopify app.

Pricing and billing

- Free plan: 3 free spins, no credit card required. Full quality, full features, unlimited views.
- Pro: \$29/month, includes 10 spins per month, then \$2.50 per extra spin.
- Views are unlimited on every plan — Spinr charges for creating spins, never for your store's traffic.
- Shopify merchants are billed through Shopify: the charge appears on the regular Shopify invoice. No card entry in Spinr.
- Upgrade and cancel are self-serve in the app's plan card. Cancelling takes effect immediately; uninstalling the app also ends billing.
- A "spin" = one generation run. Failed generations are automatically refunded — you are never charged for a failure. Regenerations count as a new spin.

Troubleshooting

- "Create spin" is disabled → the product has no photos on Shopify. Add at least one photo to the product first.
- The spin doesn't appear on my product page → make sure you clicked "Push to page" AND completed the one-time theme setup ("Add the Spinr

block", then Save in the Theme Editor).

- The spin looks wrong (spins the wrong way, odd artifacts) → click

Regenerate. AI generation varies between runs; one retry usually

fixes it. Regeneration uses one spin credit.

- The app shows "reopen the app in a few seconds" → temporary setup

delay on a fresh install; reopening the app resolves it.

- The spin briefly shows an error on very first load of the day → the

page retries automatically; reload if needed.

- My product photos show a pair but I want one item → that's automatic;

the spin renders a single item. If it doesn't, regenerate.

Data & privacy

- Product photos are processed by AI services to generate the spin, and

the resulting media (video + frames) is stored so the spin can be

served to shoppers.

- Spinr does not collect shoppers' personal data through the embed.

Contact / escalation

If you can't answer a question, or the user asks about billing disputes,

refunds, account deletion, or anything account-specific: collect the

user's email address and tell them the founder will reply personally.

Support email: contact@thespinr.com (typical reply within one business

day).
